ELECTRONICS # 1 FUNDAMENTALS

2/2/2011

Electric Charge

2

In an electric circuit there is a conservation of charge. The net electric charge is constant. There are positive and negative charges. Like charges repel while unlike charges attract. The SI unit for electric charge (q) is the Coulomb (C)

2/2/2011

Electric Energy

3

Energy is the ability to perform work and has the same units as work: Work = force x dist. The SI unit for energy (w) is the Joule (J).

2/2/2011

Basic Variables

4

Quantity	Symbol	Unit
Mass	m,M	kg
Length	l,L	meter,m
Time	t	sec, s
Energy	w,W	joule, J
charge	q,Q	coulomb, C

Lower case usually indicates a time variant unit.

2/2/2011

Electric Current

5

Charge is moved through a circuit as current, which is simply a measure of the charge transferred/sec. The SI unit is the Ampere with the symbol (A).

$$i = \frac{dq}{dt} = I = \frac{Q}{t} \quad \left(\frac{\text{Coulombs}}{\text{s}}\right)$$

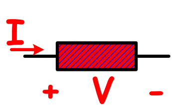
2/2/2011

Voltage

6

The work performed/unit charge while moving a charge from one point to another in a circuit is voltage. Voltage is analogous to pressure. The SI unit for voltage is the volt (v)

$$V = \frac{dw}{dq} \quad \left(\frac{\text{joules}}{\text{coulomb}}\right) = \text{volts}$$



2/2/2011

Power

7

Power (P), watt, w

$$P = \frac{dw}{dt} \quad \left(\frac{\text{joules}}{\text{sec}}\right) \text{ or } (\text{watt})$$

$$P = VI$$

Power is defined as the rate of energy transfer

Resistance

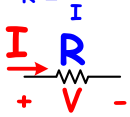
8

Resistance (R) unit is the Ohm (Ω)

A resistance is an element which dissapates energy and can not store energy

$$i = \frac{V}{R} \Leftarrow \text{Ohm's Law} \Rightarrow V = IR$$

$$R = \frac{V}{I}$$

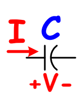


Capacitance

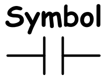
9

A capacitor is an element which stores energy in an electric field. This energy is returned to the circuit later. The SI unit for capacitance (C) is the farad, F.

$$C = \frac{i}{dv/dt}$$



Alternate Symbol



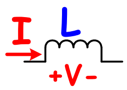
$$i = C\, dv/dt \quad \text{and} \quad V = \frac{1}{C}\int_0^t i(t)dt + V(0)$$

Inductance

10

An inductor (Coil) is an element which stores energy in a magnetic field. The energy is the returned to the circuit later. The SI unit for Inductance (L) is the Henry, H.

$L=\frac{v}{di/dt}$ or $v=L\frac{di}{dt}$ and $i=\frac{1}{L}\int_0^t v(t)\,dt + i(0)$



2/2/2011

Electrical variables

11

Quantity	Symbol	Unit
Current	i(I)	Ampere, A
Voltage	v(V)	Volt, V
Power	p(P)	Watt, W
Resistance	R	Ohm, Ω
Capacitance	C	Farad, F
Inductance	L	Henry, H

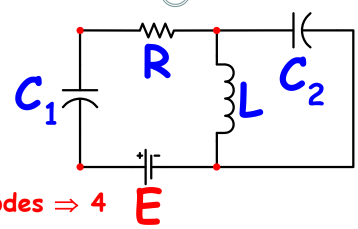
Some definitions

12



nodes ⇒ 4

loops ⇒ 3

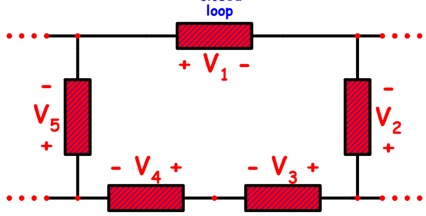
meshs ⇒ 2 (also known as panes)

2/2/2011

Kirchhoff's Voltage Law (KVL)

13

$$KVL :\triangleq \sum_{\substack{closed \\ loop}} V = 0$$



$$V_1 - V_2 + V_3 + V_4 + V_5 = 0$$

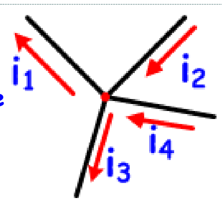
2/2/2011

Kirchhoff's Current Law(KCL)

14

$$KCL \triangleq \sum_{node} i = 0$$

currents entering a node are defined as -
currents leaving a node are defined as +



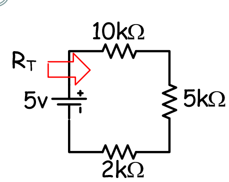
$$i_1 - i_2 + i_3 - i_4 = 0$$

2/2/2011

Total Resistance of Series Elements

15

When resistors are in series, the total resistance is simply the sum of the resistors.



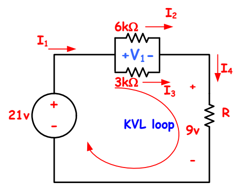
$$R_T = 10k\Omega + 5k\Omega + 2k\Omega = 17k\Omega$$

2/2/2011

KVL/KCL Example 1

16

Determine the unknown voltages, currents, and R in the circuit to the right.



Step 1:
Perform a KVL to find the voltage across the 2 parallel resistors, V_1:

$$0 = -21v + V_1 + 9v$$

The 2 resistors share the same voltage.

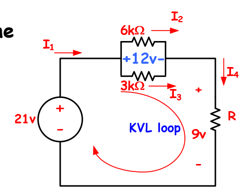
$$V_1 = 21v - 9v = \boxed{12v}$$

Example continued on the next slide.

KVL/KCL Example 1 (cont)

17

Now that V_1 is known, the currents thru the 2 parallel resistors can be found via Ohm's Law.



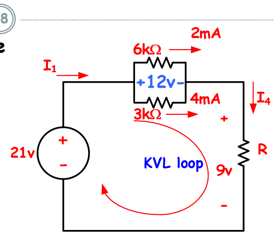
$$I_2 = \frac{12v}{6k\Omega} = \boxed{2mA} \qquad I_3 = \frac{12v}{3k\Omega} = \boxed{4mA}$$

Example continued on the next slide.

KVL/KCL Example 1 (cont)

18

Next, use KCL to determine the value of I_1. Perform a KCL at the node to the left of the parallel combination:



$$0 = I_1 - 2mA - 4mA$$

$$I_1 = \boxed{6mA}$$

Finally, with the value of I_1, use Ohm's law to determine the value of R:

$$R = \frac{V_R}{I_1} = \frac{9v}{6mA} = \boxed{1.5k\Omega}$$

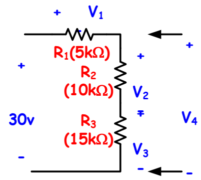
Voltage Divider example

19

$$V_1 = \frac{30\,(5k\Omega)}{5k\Omega + 10k\Omega + 15k\Omega} = \frac{150}{30} = \boxed{5v}$$

$$V_2 = \frac{30\,(10k\Omega)}{30k\Omega} = \frac{300}{30} = \boxed{10v}$$

$$V_3 = \frac{30\,(15k\Omega)}{30k\Omega} = \frac{450}{30} = \boxed{15v}$$



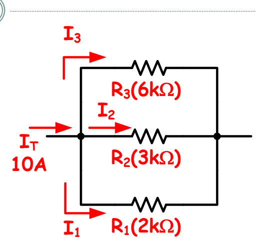
$$V_4 = \frac{30\,(10k\Omega + 15k\Omega)}{30k\Omega} = \frac{30\,(25)}{30} = \frac{750}{30} = \boxed{25v}$$

2/2/2011

Current Divider example

20

$$I_1 = \frac{10A\,(6k\Omega \,||\, 3k\Omega)}{2k\Omega + (6k\Omega \,||\, 3k\Omega)} = \frac{10A\,(2k\Omega)}{2k\Omega + (2k\Omega)} = \frac{20A}{4} = \boxed{5A}$$



$$R_T = \frac{1}{\frac{1}{6k} + \frac{1}{3k} + \frac{1}{2k}} = 1k\Omega$$

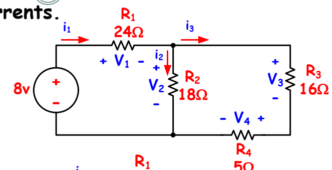
$$R_{1||2} = \frac{R1\,(R2)}{R1 + R2} = \frac{2k\,(3k)}{2k + 3k} = 1.2k\Omega$$

2/2/2011

Example

21

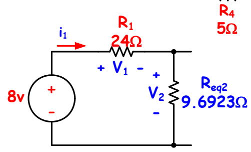
Find all voltages and currents.
Verify with KVL.



1st, reduce the circuit.

$$R_{eq1} = R_3 + R_4 = 16\Omega + 5\Omega = \boxed{21\Omega}$$

$$R_{eq2} = R_2 \,||\, R_{eq1} = \frac{18\Omega\,(21\Omega)}{18\Omega + 21\Omega} = \boxed{9.6923\Omega}$$

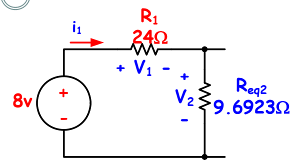


Example continued on the next slide.

2/2/2011

Example (continued)

22



$$I_1 = \frac{8v}{24\Omega + 9.6923\Omega}$$
$$= 237.443mA$$

$$V_1 = I_1 R_1$$
$$= (237.443mA)\,24\Omega$$
$$= 5.6986v$$

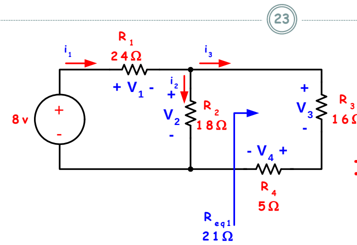
$$V_2 = I_1 R_{eq2}$$
$$= (237.443mA)\,9.6923\Omega$$
$$= 2.3014v$$

Example continued on the next slide.

2/2/2011

Example (continued)

23



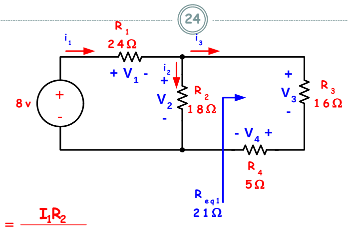
$$I_2 = V_2 / R_2$$
$$= 2.3014v / 18\Omega$$
$$= 127.8556mA$$

Example continued on the next slide.

2/2/2011

Example (continued)

24



$$I_3 = \frac{I_1 R_2}{R_2 + R_{eq1}}$$
$$= \frac{237.443mA\,(18\Omega)}{18\Omega + 21\Omega}$$
$$= \boxed{109.5891mA}$$

or

$$0 = -I_1 + I_2 + I_3$$
$$I_3 = I_1 - I_2$$
$$= 237.443mA - 127.8556mA$$
$$= \boxed{109.5874mA}$$

Difference is due to round off.
